Agriculture: The Beginnings
Developments in Europe
Special Development: The Plaggen

Fig 7:1 The limits of plaggen soil distribution in Western Europe (prepared by J. C. Pape, Soil Survey Institute, Wageningen, Netherlands). Plaggen soils are sandy soils that have been fertilised for several centuries with manure, seaweed, and sods. They have deep Ap horizons, rich in phosphate.

Terra Preta is a blend of all natural compost and peat moss. The compost is mixed in a unique recipe which gives you the best growing media.

The all-natural, high-quality starting material has undergone extensive composting processes using a unique blend of natural materials to create a material that has the desired physical and nutritional properties to ensure growth. It has high nutrient loads and a high moisture and nutrient exchange and retention capacity.

The product's fine texture and ease of application make it ideal for many treatments that are designed to improve the soil. We were careful not to sacrifice quality for anything else sensible. We think that our mix is the best.
• The Carbon Story: The Beginning and the End.

• Thank you.
